

# OCI & Cloudflare Setup

This page documents the initial deployment of the cloud instance and the configuration of the external network layer using Cloudflare.

## 1. Oracle Cloud Infrastructure (OCI) Setup

The primary compute instance is hosted on OCI using an **Ampere A1 (ARM)** or **AMD** instance with Ubuntu Server.

### Key Steps in OCI Console:

- **Instance Creation:** Deployment of an Ubuntu 22.04 LTS instance.
- **VCN & Security Lists:** Configuration of Ingress Rules to allow specific traffic:
  - Port 22 (SSH) - Restricted access.
  - Port 80 (HTTP) - Open for initial verification and ACME challenges.
  - Port 443 (HTTPS) - Primary port for encrypted web traffic.

**Internal Firewall Adjustment:** Since Ubuntu on OCI comes with pre-configured iptables rules, they were updated to allow web traffic:

```
# Allow HTTP and HTTPS through the local iptables
sudo iptables -I INPUT 6 -m state --state NEW -p tcp --dport 80 -j ACCEPT
sudo iptables -I INPUT 6 -m state --state NEW -p tcp --dport 443 -j ACCEPT

# Save the rules persistent
sudo netfilter-persistent save
```

## 2. Cloudflare Integration

Cloudflare is used as the DNS provider and as a security proxy to hide the origin server's IP address.

### DNS Configuration:

- An **A-Record** was created pointing to the OCI instance's public IP.
- **Proxy Status:** Set to "Proxied" (Orange Cloud) to ensure all traffic passes through Cloudflare's edge servers first.

### SSL/TLS Settings:

- **SSL Mode:** Set to "**Full (Strict)**". This ensures end-to-end encryption between the user, Cloudflare, and the OCI server.
- **Always Use HTTPS:** Enabled to force all unencrypted requests to upgrade to a secure connection.

### 3. Domain Resolution Check

Once the DNS propagation was complete, the connection was verified using the terminal to ensure the Cloudflare IP is being returned instead of the real server IP.

```
# Check DNS resolution
nslookup your-domain.com

# Verify that the web server is responding via Cloudflare
curl -I https://your-domain.com
```

### 4. Security Benefit

By using this hybrid setup:

1. **IP Masking:** Attackers cannot see the real IP of the Oracle instance.
2. **DDoS Protection:** Cloudflare automatically mitigates volumetric attacks before they reach the server.
3. **WAF:** Basic firewall rules at the edge block common malicious patterns.
